

## Dual-ionic pH-sensitive Copolymers for Versatile Biomedical Applications

**Doo Sung Lee**

*School of Chemical Engineering, Theranostic Macromolecules Research Center,  
Sungkyunkwan University, Suwon, Republic of Korea*

Controlled delivery of molecules in response to the microenvironment can influence the treatment. We developed a series of dual-ionic pH-sensitive poly(urethane amino sulfamethazine)-based random copolymer for the controlled release of various therapeutic agents. Owing to the unique characteristics of poly(urethane amino sulfamethazine), it exhibited a dual ionic pH-sensitive property in an aqueous solution. At high pH (~pH 8.5), the copolymer exhibited a negative charge and was water soluble due to the presence sulfamethazine groups. On the other hand, at low pH (~pH 5.0), the copolymer transformed to cationic due to the ionization of tertiary amine groups. Interestingly, at the physiological condition (pH 7.4), poly(urethane amino sulfamethazine) copolymer could form a particulate structure and encapsulate protein/drugs effectively via the ionic and hydrophobic interaction between polymer and protein/drugs. The dual-ionic pH-sensitive characteristics of the copolymers were used in the controlled delivery of protein/drugs to treat various intractable diseases.

**Author Biography:** He received his B.S. degrees in Chemical Engineering from the Seoul National University in 1978 and his M.S. and Ph.D. from KAIST in 1984. He joined the faculty of Sungkyunkwan University (SKKU) in 1984. He has been a director of Theranostic Macromolecules Research Center (ERC) supported by National Research Foundation of Korea from 2010. He was elected as a member of Korean Academy of Science and Technology in 2011 and National Academy of Engineering of Korea in 2007. He was a president of the Polymer Society of Korea in 2013.
